

## 3rd Level Facts & Features

This was designed to be the main room and was the original entrance level.

Duck fat was smeared between the plates to make the lighthouse watertight to the 3rd level.

The receiver you see here would have been used aboard a ship to pick up the lighthouse radio beacon.

Note the trap doors in the floor and ceiling. These were used to move heavy items between levels, with block and tackle.

To the left of the door there was a stove to heat the area during the cool winter months. Note the flue hole cover.

The black wall across from the stairs held sea surveillance radar and viewing scopes for tracking boats during early rocket launches. There was an antenna outside the lamp room.

Note the curvature of the doors to conform to the circular stairwell.
